

DO YOU SUSPECT MYCOPLASMA CONTAMINATION?

Then **MycoSolutions™** is your answer!

Don't let Mycoplasmas be widespread contaminants in your cell culture. It has been reported that 5-35% of cell cultures in current use are infected which could lead to diminished cell growth, the loss of cultures, poor reproducibility and reduced metabolic activity.

At Akron Biotech we are now offering the best-in-class series of Mycoplasma products for the detection, prevention and elimination of contaminated cultures. The **MycoSolutions™** line of products is joining our leading pool of products that consists of high quality Animal Sera, Biological Reagents, and Cell Culture products.

Our antibiotic formulations are designed to eliminate Mycoplasma contaminated cultures quickly and proficiently. Contamination of cells with Mycoplasma is very common and often goes unnoticed for the simple fact that no cloudiness appears in the cell culture. Since you can't always discard the Mycoplasma-infected cells and creating a new cell bank is not always an option, we recommend that you use our antibiotic treatment.

Your benefits to using **MycoSolution™ series of antibiotics** include, cost effectiveness, ease of use, fast results and a broad spectrum of effectiveness.

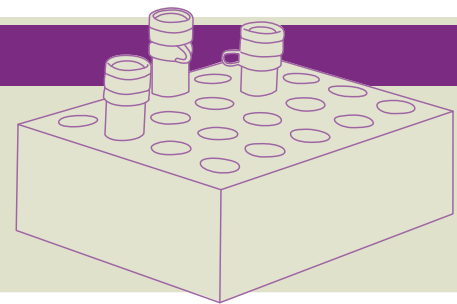

We know that there are several methods for detection of Mycoplasma available, but the best results for detection can only be achieved through PCR (Polymerase Chain Reaction) based methods.

Akron Biotech's MycoSolutions™ Detection Kit, a PCR-based kit, detects Mycoplasma easily by verifying the bands of amplified DNA fragments in an electrophoresis gel. By using our kit, you will get reliable, quick and sensitive results.

Akron Biotech's MycoSolution™-1, MycoSolution™-2, MycoSolution™-3, have been shown to be effective in the eradication of Mycoplasma species that account for at least 90% of the contamination found in cell cultures.

Eliminate Mycoplasma Today!
